

**EAR MUFFS - Clarity Sound Management**

Research in Sweden in recent years revealed that removal of hearing protectors for short periods of time caused effective protection to drop dramatically also showed that the reason for this was to enable a person to hear speech. This led to a modern patented Natural Sound Technology - NST, that allows for speech to be heard, while reducing background noise. Hence the Clarity Sound Management concept.

**EAR MUFFS - Conventional Noise Blocking**

Although the SNRs may be slightly higher than the Clarity range above, the over-attenuation will lead to muffled speech, forcing the user to remove the hearing protector and potentially exposing the user to hearing loss.
